

# RECOAT: Strategies and practices to increase the renewable carbon content of coatings

Coatings Innovatiedag, June 18<sup>th</sup>, 2025

**Rolf Blaauw**

Wageningen Food & Biobased Research

# Outline

- Wageningen Food & Biobased Research (WFBR)
- The RECOAT project
- Approaches to improve sustainability of paints and coatings
- Focus on **coating binders**:
  - R&D projects: EPIC, SMARTCASE

# Wageningen Food & Biobased Research (WFBR)

- **Contract research organization**
- More than 30 years of experience in the development of technologies to produce **biobased chemicals and materials**
- **over 250 highly qualified experts**
- Close link to the Wageningen University departments
- Modern laboratories and a fully equipped **biobased products innovation plant**
- Research from initial idea to production pilot scales and processes

# Society-oriented research programmes

Nature Based Materials

Renewable Plastics

Safe and Circular  
Biobased Products

Circular Water  
Technologies

Food Loss and Waste  
Prevention

Postharvest Quality

Agro Food Robotics

Proteins for Life

Sustainable Nutritious  
Foods

Nutrition for Optimal  
Health

# Safe and Circular Biobased Products

**Developing looping strategies and safe, biobased alternative processes, chemicals and materials for circularity**

Circular design of coatings and composites

Biodegradable alternatives to products that end up in sewage water

Safe and sustainable substitutes for substances of (very high) concern

Towards safe and circular (food) packaging materials

# WFBR-led project – RECOAT

- Dutch consortium of suppliers of biobased chemicals, paint/coating companies and research institutes
- Exchange of knowledge: what is already available and possible?
- Understanding hurdles for getting biobased formulations into the market
- Establish new connections and supply chains
- Deliverable: booklet (Q3 2025) on biobased coatings for broad audience (English & Dutch)

# Approaches to improve sustainability of coatings

- Substitution of fossil-based components by **biobased alternatives**
  - Raw materials considered to have the largest impact on carbon footprint
- Reduce **VOC levels** (solvent-borne → waterborne)
- Increase (biobased) **recycled content** in coating formulation
- Others, e.g.:
  - measures that enable thinner coatings
  - increase durability / service life of coated products
  - switch to a more sustainable coating technology (solvent-borne → powder)

# The only three sources of renewable carbon

Biomass

(This presentation)

Direct CO<sub>2</sub>  
utilisation

Recycling of  
carbon-based  
materials

# Paints and coatings production chain (simplified)

# Approaches to increase the biobased content of coating binders

1. Develop improved versions of traditional **biopolymer binders**
2. Polymerize biobased monomers to create **new polymeric binder types**
3. Polymerize biobased monomers with the same polymerizable group as their petrochemical counterpart but with a different structure to create **biobased 'look-alikes' of petrochemical binders**
4. Polymerize biobased monomers with a structure identical to their petrochemical counterparts ('drop-ins') into **biobased versions of existing petrochemical binders**

# Biopolymers versus biobased polymers

- Biopolymers = naturally occurring polymers like cellulose, chitin, starch, lignin, proteins
  - Most abundant biomass constituents
  - Typically, very high molecular weight
  - Insoluble by nature (cellulose, chitin, lignin); difficult to chemically modify
  - Water-soluble types are highly viscous even at low concentrations
  - Limited design flexibility

# Biopolymers versus biobased polymers

- Biobased polymers = man-made /synthetic polymers based on biobased building blocks
  - Easier to introduce water- and temperature resistance
  - Much more **design freedom**; many combinations of building blocks possible
  - Biobased building blocks can be used for the main classes of binders for paints and coatings:
    - Polyesters (including alkyds)
    - Vinyl polymers: poly(meth)acrylates, styrene copolymers, polyvinyl acetate etc.
    - Polyurethanes
    - Epoxy resins

# Simplified structure of five main binder types

# Routes from biomass to binder building blocks

# Two recently started WFBR-projects on biobased resins

- Biobased acrylics: **EPIC** project

- Biobased isocyanate/epoxy-free 2K resins: **SMARTCASE**

# EPIC: biobased acrylics

# EPIC: biobased acrylics

# EPIC: biobased acrylics

Commercial example:  
Decovery® by Covestro

- Acrylic and methacrylic acid are not (yet) biobased.  
Bio-based alternative: itaconate esters

- Bio-based alcohols used: *n*-butanol, ethanol, 2-octanol, isobornyl alcohol

↓  
from castor oil

↓  
from tree bark  
terpenes

# EPIC: biobased acrylics

isobornyl acrylate

isobornyl methacrylate

2-octyl acrylate

tetrahydrofurfuryl acrylate

vanillin methacrylate

isosorbide methacrylate

|             |      |       |       |       |       |      |
|-------------|------|-------|-------|-------|-------|------|
| Biobased C  | 77%  | 71%   | 73%   | 63%   | 67%   | 60%  |
| $T_g$ (°C)* | 97°C | 150°C | -44°C | -11°C | 110°C | 80°C |

\*  $T_g$  (glass transition temperatures) of the homopolymers.

- Suppliers of (some of) these (meth)acrylates include Evonik (Visiomer Terra®), Allnex (Ebecryl®), BASF, Arkema (SARBIO®), and others.

# Take-home messages

- Biobased alternatives for typical building blocks for coating binders are slowly entering the market
- Biobased coating resins are increasingly being promoted and offered by resin suppliers
- Further market penetration relies on factors such as:
  - sufficient availability of building blocks
  - performance benefits that would justify a higher price
